Recruitment screening build sheet

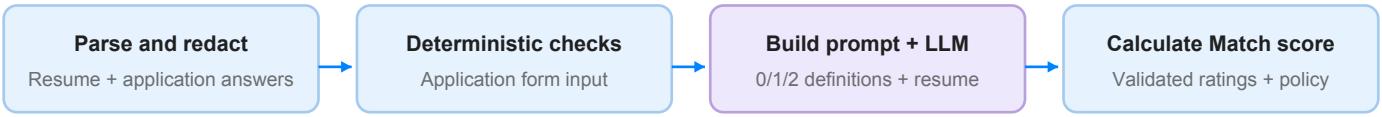

Workflows, enterprise data and delivery scope

Solution architecture

Production components; arrows show calls and returned data. Demo: SQLite + Gemini; messaging/calendar adapters simulated.

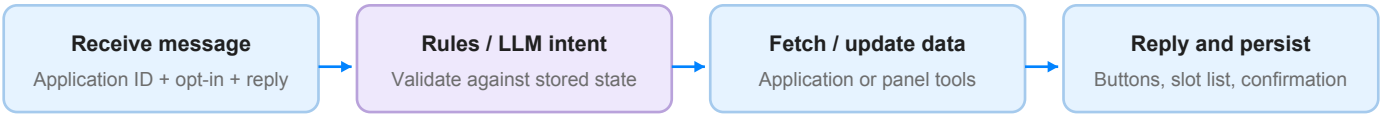

1. Screening workflow

Ingestion: extract text locally; OCR scans before inference. Send normalized text, **not full PDF/images**, to reduce model costs. **Redact name and location**; legal/privacy checks determine further masking (e.g. education institute), retaining relevant qualifications. Unreadable inputs/model errors pause scoring. **Prototype:** name/contact masking exists; OCR and location/institute masking remain to build.

LLM output - illustrative, one of six criteria: {"ratings": [{"key": "leadership", "rating": 2, "quotes": ["Led 24 associates across two shifts"], "rationale": "Direct evidence of shift team leadership."}]}
Code compiles editable 0/1/2 definitions into a fixed prompt/schema, validates output and computes Match score. Store ratings, evidence, rationale and policy/model/prompt versions.

2. WhatsApp conversation workflow

SMS links to a mobile page with the WhatsApp scheduling experience; reuse state, routing, tools and storage. Rules handle buttons; Gemini handles free text, validated against state. Re-screen missing answers. Fetch shared slots; exclude prior offers/bookings. Recheck and book/replace atomically, keeping the original until confirmed. Log results; escalate by 36h. **SMS page not prototyped.**

Warehouse shift manager role scoring rubric

Shift manager defaults: 3+ years preferred, not a hard gate. Demo gates: shift/site/start; salary/visa checks planned.

Scoring parameter	Weight	Evidence assessed semantically
Warehouse operations experience	20%	3+ years preferred; inbound, inventory and dispatch planning.
Shift & people leadership	35%	Rosters, staffing, coaching and shift handovers.
Warehouse technology & data	10%	WMS, dashboards and using KPIs to manage a shift.
Safety & compliance leadership	15%	Safety briefings, incident response and corrective actions.
Operational improvement	10%	Identify bottlenecks; implement better workflows and SOPs.
Measurable operational impact	10%	Throughput, accuracy, cost or service improvement.

Ratings: 0 No evidence; 1 Limited evidence; 2 Clear evidence. Use criterion anchors; impact requires measurable results. **Match score = 100 * sum(weight_fraction * rating / 2)**; round to two decimals. Threshold (default): 70; below rejects, equality passes. **Buckets:** Poor 0 to <50; Fair 50 to <70; Good 70 to <86; Excellent 86 to 100. At 80 eligible applicants/role/batch (provisional), prioritize buckets then deadlines; otherwise deadlines only. Never rank scores within buckets.

Impact and delivery checks

Planning assumptions must be replaced with pilot measurements

Design for the distribution of demand

400k applications / 20k hires = **20 per hire**. Assume **p90 = 80 applications/requisition**; use search, filters, bulk actions and 15-row pages. Load-test 500-applicant roles and 11k/day (5x average, 2x headroom). Validate assumptions.

Impact table

Measure	Baseline or assumption	Pilot target and validation
First meaningful outreach	Case median: 9 days	Attempt outreach before 48h; p95 delivered <48h. Track failures and breaches.
Screening coverage	Case: not all resumes read	100% ingested; visible parse failures; no lost/duplicate application events.
Scheduling effort	Estimate: 10-20 active minutes per interview	70% less coordination; track booking time, attendance and capacity separately.
Qualified candidates missed	Unknown; historical decisions are incomplete labels	<=2% FNR on reviewed interview labels; report uncertainty and fairness checks.
Residual human workload	Scenario: 15% remain unresolved after chat; 4 min each	60k escalations = 4k staff hours/year; measure handoffs. Escalate by 36h. Unvalidated.
AI processing cost	Scenario: $0.02-$0.10 per application	$8k-$40k/year at 400k. Excludes messaging, storage, integrations and review; unvalidated.

Model alternative (not selected for MVP). Models such as TypeSafe Jev could lower costs with typed scores/decisions. **We prioritize explainability over cost:** ratings need rationale and resume evidence; score-only models need an extra evidence layer.

System administrator journey

One-time setup: toggle feature opt-in; select channels (WhatsApp, SMS, email); connect an enterprise email account for panel-calendar access. Choose enterprise-managed role rubrics or job-level rubrics, and whether hiring managers may override the rubric. Reuse existing jobs and JDs. **The detailed administrator experience is not covered in this design.**

Asynchronous provisioning: enabling the feature enqueues all existing jobs. Background workers use JDs and enterprise settings to generate thousands of role/job rubrics, validate and store versions, and track per-job readiness. Show progress and retry failed jobs; scoring starts for each job when its rubric is ready. Enterprise mode controls role rubrics; job mode attaches them to jobs. Version permitted overrides.

Two month build and release plan

Weeks 1-2: PM, talent operations and local counsel agree rules, country gates and metrics. **Weeks 3-4:** build admin settings, async rubric provisioning, scoring and booking; integrate WhatsApp and SMS scheduling links, consent and delivery tracking. **Weeks 5-6:** shadow-test scoring, channel retries and calendar conflicts. **Weeks 7-8:** pilot selected sites and release where gates pass.

Release checks

Historical quality gate. Use historical binary **send for interview / do not send** labels, not per-score labels. History can carry bias; non-hires do not prove poor fit. Manually review both disagreements: **apparent false positives** (LLM passes, no historical interview) and **apparent false negatives** (LLM rejects, historical interview). Correct labels and version the evaluation set, then re-evaluate. **FNR = rejected interview-positive cases / all interview-positive cases**, using reviewed labels. Provisional: **FNR <=2%; true-positive rate >=98%**. Review disagreements, not every score.

Scheduling constraint (not prototyped). Intersect free/busy with each panel member's local working hours, using IANA time zones and daylight-saving rules; compare in UTC. DB fields are prepared. **Checks:** extraction/injection, duplicates, conflicts, outages and closure; require audit, escalation, country sign-off, kill switch and manual fallback.

LLM pitfalls and controls

1. **Resume prompt injection.** Isolate untrusted text; constrain outputs; test hidden instructions.
2. **Non-linear careers.** Assess transferable work, not career gaps or conventional job titles.
3. **Brand/jargon bias.** Redact agreed proxies; test niche vocabulary and equivalent experience.
4. **Complex PDF layouts.** Check text/OCR reading order; failed extraction pauses scoring.
5. **AI-tailored resumes.** Require concrete work evidence, not JD similarity; claims remain unverified.

Evaluation coverage. Prepare evaluation data for all five scenarios above. Test each and iteratively refine the prompt until agreed quality and robustness thresholds are met.

Demo: Live Gemini and saved scores/bookings; calendar access and WhatsApp delivery are simulated.
